Amendments to the Claims:

This listing of claims will replace all prior versions and listings of claims in the

application:

Listing of the Claims:

1. (Currently Amended) A single-slot multi-flash-card reader comprising:

an Integrated Device Electronics (IDE) interface for transferring data to a

personal computer;

an IDE converter, coupled to the personal computer IDE interface, for converting

multiple flash-card interfaces to a format used by the personal computer IDE interface;

wherein the multiple flash-card interfaces include a CompactFlash interface and

smaller interfaces having fewer pins that the CompactFlash interface:

a CompactFlash connector, coupled to the IDE converter, for receiving a

CompactFlash card through a single slot in the single-slot multi-flash-card reader, the

CompactFlash connector making electrical connection with the CompactFlash card for

signals in the CompactFlash interface:

an adapter, having a physical shape to removably insert into the CompactFlash

connector, the adapter having a mating CompactFlash connector that fits the

CompactFlash connector, the adapter also having a smaller connector, the smaller

connector for fitting to other flash-memory cards having the smaller interfaces; and

wiring means, in the adapter, connected between the smaller connector and the

mating CompactFlash connector, for directly connecting signals from the smaller

connector in the smaller interface with signals in the mating CompactFlash connector,

wherein the wiring means connects card select signals from all of the smaller interfaces to

Page 2 of 17

Appl. No.: 10/039,685

card select signals in the CompactFlash connector, the IDE converter includes card-detect

means, coupled to sense the card select signals, for detecting presence of a flash-memory

card inserted into the CompactFlash connector, the IDE converter detects presence of

CompactFlash and the other flash-memory cards having the smaller interfaces, the wiring

means connects signals from the smaller interfaces to signals CE1, CE2 in the

CompactFlash connector, the IDE converter includes card-type-detect means, coupled to

sense the signals, for detecting a type of a flash-memory card inserted into the

CompactFlash connector, the IDE converter includes card-type-detect means, coupled to

sense the signals, for detecting a type of a flash-memory card inserted into the

CompactFlash connector, the type of flash-memory card detected includes CompactFlash

cards and smaller flash-memory cards having the smaller interface, and the IDE converter

detects the type of flash-memory card inserted including CompactFlash and the other

flash-memory cards having the smaller interfaces;

whereby the adapter allows the other flash-memory cards having the smaller

interfaces to fit into the CompactFlash connector through the single slot to be read by the

IDE converter.

2. Canceled.

3. Canceled.

4. (Currently Amended) The single-slot multi-flash-card reader of claim 3 1.

wherein the signals comprise signals CE1, CE2, address signals A0, A1 signals in the

CompactFlash interface;

Appl. No.: 10/039,685 Amdt. dated 8/20/2004

Page 3 of 17

wherein the A1 signal is connected to a serial data signal in the smaller interface

when the smaller interface is a MultiMediaCard, Secure Digital interface or a Memory

Stick interface,

whereby type detection is performed using the CE1, CE2 signals connected to the

serial data signal of the smaller interfaces.

5. (Original) The single-slot multi-flash-card reader of claim 4 wherein each

type of the flash-memory cards for the smaller interfaces drives signals connected to the

signals by the adapter to different logic levels;

wherein CompactFlash cards do not drive the signals,

whereby the signals float for CompactFlash cards, but at least one of the signals

· are driven by the other flash-memory cards having the smaller interfaces when connected

by the adapter.

6. (Original) The single-slot multi-flash-card reader of claim 5 further

comprising:

pull-up resistors, connected to the signals from the CompactFlash connector, for

pulling the signals high when the IDE converter and the flash-memory card are not

driving signals connected to these signals,

whereby the pull-up resistors assist card-type detection.

7. (Original) The single-slot multi-flash-card reader of claim 6 wherein the

wiring means is a passive wiring means without active components including integrated

Page 4 of 17

circuit chips, transistors, resistors, or capacitors,

Appl. No.: 10/039,685 Amdt. dated 8/20/2004

whereby the adapter is a passive adapter.

8. (Original) The single-slot multi-flash-card reader of claim 7 wherein the

smaller interfaces are selected from the group consisting of MultiMediaCard, Secure

Digital, and Memory Stick flash-memory-card interfaces.

9. (Original) The single-slot multi-flash-card reader of claim 8 further

comprising:

a second adapter, having a physical shape to removably insert into the

CompactFlash connector, the second adapter having a mating CompactFlash connector

that fits the CompactFlash connector, the second adapter also having a second smaller

connector, the second smaller connector for fitting to a SmartMedia flash-memory cards

having the smaller interface for SmartMedia,

whereby the second adapter connects SmartMedia flash-memory cards to the

CompactFlash connector.

10. (Original) The single-slot multi-flash-card reader of claim 9 further

comprising:

a third adapter, having a physical shape to removably insert into the

CompactFlash connector, the third adapter having a mating CompactFlash connector that

fits the CompactFlash connector, the third adapter also having a third smaller connector,

the third smaller connector for fitting to a Memory Stick flash-memory cards having the

smaller interface for Memory Stick,

whereby the third adapter connects Memory Stick flash-memory cards to the

Page 5 of 17

Appl. No.: 10/039,685 Amdt. dated 8/20/2004

CompactFlash connector.

11. (Original) The single-slot multi-flash-card reader of claim 10 wherein the

CompactFlash interface has 50 pins including power and ground pins;

wherein the smaller interfaces have no more than 10 pins including power and

ground pins.

12. (Original) The single-slot multi-flash-card reader of claim 10 wherein the

IDE converter further comprises:

serial-to-parallel means, receiving serial data from the smaller interfaces, for

converting serial data to a parallel data format for transfer to the personal computer,

whereby serial data from the smaller interfaces is converted to parallel, but

parallel data from CompactFlash cards are not converted.

13. (Original) A multi-flash-card reader comprising:

an integrated Device Electronics (IDE) connection for transferring data to a host

computer;

an Integrated Device Electronics (IDE) converter chip, coupled to the host

connection, for converting signals from flash-memory cards to read data from the flash-

memory cards for transfer to the host computer;

a first connector, coupled to the converter chip, for accepting a CompactFlash

card inserted into a first slot for the first connector, the first connector having a parallel-

data bus and an address bus and control signals for controlling parallel data transfer from

Page 6 of 17

the CompactFlash card to the IDE converter chip;

Appl. No.: 10/039,685

Amdt. dated 8/20/2004

Reply to Office Action of May 24, 2004

a second connector, coupled to the IDE converter chip, for accepting a

SmartMedia card inserted into a second slot for the second connector, the second

connector having a parallel-data bus and control signals for controlling parallel data

transfer from the SmartMedia card to the IDE converter chip; and

a third connector, coupled to the IDE converter chip, for accepting a

MultiMediaCard or Secure Digital card inserted into a third slot for the third connector,

the third connector having a serial-data pin and a clock pin for controlling serial data

transfer from the MMC card (SD Card) to the IDE converter chip;

wherein the IDE converter chip controls parallel data and address transfer for the

CompactFlash card, parallel data transfer for the SmartMedia card, and serial data

transfer for the MMC card,

whereby multiple flash-memory cards can be read by the multi-flash-card reader

using the IDE converter chip.

14. (Original) The multi-flash-card reader of claim 13 wherein the first

connector, the second connector, and the third connector each have card detect signals for

detecting presence of a flash-memory card inserted into a connector;

wherein the IDE converter chip senses a voltage change in the card detect signals

from a connector and activates a routine to access the flash-memory card activating the

card detect signals,

whereby flash-memory cards are detected by the IDE converter chip.

15. (Original) The multi-flash-card reader of claim 14 further comprising:

a fourth connector, coupled to the IDE converter chip, for accepting a Memory

Appl. No.: 10/039,685

Page 7 of 17

Stick card inserted into a fourth slot for the fourth connector, the fourth connector having

a serial-data pin and a clock pin for controlling serial data transfer from the Memory

Stick card to the IDE converter chip;

wherein the IDE converter chip also controls serial data transfer for the Memory

Stick card.

16. (Original) The multi-flash-card reader of claim 15 wherein the host

connection is through an external cable to the host computer;

wherein the multi-flash-card reader is in an external housing separate from the

IDE computer chassis,

whereby the multi-flash-card reader is external.

17. (Original) The multi-flash-card reader of claim 16 further comprising:

a removable mass storage, coupled to the IDE converter chip, for accepting a

removable disk through a fifth slot in the external housing, the removable mass storage

storing data from the flash-memory card in response to the IDE converter chip,

whereby data is transferred to the removable mass storage.

18. (Original) The multi-flash-card reader of claim 17 further comprising:

an activating switch, closable by a user, for initiating transfer of data from a flash-

memory card inserted into the first, second, or third connector to the removable mass

storage, the activating switch coupled to activate a transfer routine in the IDE converter

chip,

whereby user-activated data transfer to the removable mass storage is initiated by

Appl. No.: 10/039,685 Amdt. dated 8/20/2004 Page 8 of 17

the activating switch.

19. (Original) The multi-flash-card reader of claim 18 wherein the activating

switch operates when the host connection is not currently connected to the host computer,

whereby the multi-flash-card reader is a stand-alone reader for transferring data

from a flash-memory card to the removable mass storage.

20. (Original) The multi-flash-card reader of claim 19 wherein the removable

mass storage accepts a removable tape or a removable rotating disk as a storage media.

21. (Original) The multi-flash-card reader of claim 15 wherein the IDE

· connection is through an internal cable to a board for the host computer;

wherein the multi-flash-card reader is in a computer chassis that contains the host

computer,

whereby the multi-flash-card reader is internal.

22. (Original) The multi-flash-card reader of claim 21 wherein the multi-

flash-card reader is located in a drive bay for an extra disk drive in the computer chassis.

23. (Original) The multi-flash-card reader of claim 15 wherein the IDE

converter chip further comprises:

a memory for storing routines for detecting presence of the flash-memory cards in

the first, second, and third connectors, and routines for transferring data from the flash-

memory card to the host computer;

Patent 006284.P013

central processing unit means for executing the routines stored in the memory;

timers, coupled to the central processing unit means, for determining a time

interval;

Input-output means, responsive to the central processing unit means, for sensing

input signals from the first, second, and third connectors, and for driving output signals to

the first, second, and third connectors;

shift means, responsive to the central processing unit means, for shifting serial

data from the third and fourth connectors, but for shifting parallel data from the first and

second connectors.

24. (Original) The multi-flash card reader of claim 23 wherein a first and a

second command from the central processing unit expands the IDE connection to a

plurality of devices.

25. (Original) The multi-flash card reader of claim 24 wherein the first

command awakens a device coupled thereto and the second command indicates a type of

device coupled to the IDE connection.

26. (Original) The multi-flash-card reader of claim 19 wherein the reader is

designed into a self hosted appliance.

27. (Original) The multi-flash card reader of claim 26 wherein the self-hosted

appliance comprises an MP3 player.

Appl. No.: 10/039,685

Amdt. dated 8/20/2004

Reply to Office Action of May 24, 2004

Page 10 of 17

28. (Original) The multi-flash card reader of claim 26 wherein the self-hosted

appliance comprises a keyboard.

29. (Original) The multi-flash card reader of claim 26 wherein the self-hosted

appliance comprises a monitor.

30. (Original) The multi-flash card reader of claim 26 wherein the self-hosted

appliance comprises stereo appliance.

31. (Original) The multi-flash card reader of claim 19 wherein the reader is

designed into handheld digital camera devices.

32. (Original) The multi-flash-card reader of claim 19 wherein the reader is

designed into handheld data collection scanner devices.

33. (Original) The multi-flash-card reader of claim 19 wherein the reader is

designed into personal digital assistant devices.

34. (Original) The multi-flash-card reader of claim 19 wherein the reader is

designed into pocket personal computer devices that use Microsoft Palm operating

systems.

35. (Original) The multi-flash-card reader of claim 19 wherein the reader is

Page 11 of 17

designed into hand terminal devices.

Appl. No.: 10/039,685

36. (Original) The multi-flash-card reader of claim 19 wherein the reader is

designed into personal communicator devices.

37. (Original) The multi-flash-card reader of claim 19 wherein the reader is

designed into advanced two-way pager devices.

38. (Original) The multi-flash-card reader of claim 19 wherein the reader is

designed into audio recorder and player devices.

39. (Original) The multi-flash-card reader of claim 19 wherein the reader is

· designed into monitoring devices.

40. (Original) The multi-flash-card reader of claim 19 wherein the reader is

designed into projector devices.

41. (Original) The multi-flash-card reader of claim 19 wherein the reader is

designed into industrial computer devices.

42. (Original) The multi-flash-card reader of claim 19 wherein the reader is

designed into printer devices.

43. (Original) The multi-flash-card reader of claim 19 wherein the reader is

designed into human input devices.

Appl. No.: 10/039,685 Amdt. dated 8/20/2004

Reply to Office Action of May 24, 2004

44. (Original) The multi-flash-card reader of claim 19 wherein the reader is designed into digital picture frame devices.
